

History of Artificial Intelligence (AI)

Artificial Intelligence (AI) is a branch of computer science that aims to create machines capable of performing tasks that normally require human intelligence, such as learning, reasoning, problem-solving, and decision-making.

The concept of AI dates back to the 1950s. In 1956, John McCarthy coined the term "Artificial Intelligence" during the famous Dartmouth Workshop, which is considered the birth of AI as a field of study. Early AI systems focused on solving mathematical problems and playing games.

During the 1960s and 1970s, researchers developed expert systems that could mimic human decision-making in specific domains. However, limited computing power and insufficient data led to periods known as "AI winters," when progress slowed significantly.

In the 1990s, AI gained renewed interest due to advances in computing technology and machine learning algorithms. A major milestone occurred in 1997 when IBM's Deep Blue defeated world chess champion Garry Kasparov.

The 21st century brought rapid advancements in AI, driven by big data, powerful processors, and deep learning techniques. AI systems began achieving remarkable results in image recognition, speech processing, natural language understanding, and autonomous vehicles.

Today, AI is widely used in healthcare, finance, education, manufacturing, robotics, and entertainment. Modern AI technologies such as machine learning, deep learning, and generative AI have transformed the way people interact with technology, making AI one of the most influential innovations of the modern era.
